Workshop Data Platform
Backup & Restore Handbook

Fictional document created for the InterSystems IRIS Vector Search workshop. Version 2026.11

1. Restoring a lab environment from a backup

Lab environments can be restored to any available backup point. Open Environments, select the lab, and choose "Restore". Pick the backup point and confirm. The lab is unavailable for the duration of the restore, which usually takes 10 to 20 minutes.

A restore replaces all data in the lab with the contents of the backup. Changes made after the backup point are lost, so export anything you need to keep before you start.

Only workspace owners can restore a lab. Production environments cannot be restored from the web interface; open a change request with the operations team instead.

2. Backup schedule and retention

Every environment is backed up automatically each night at 02:00 UTC. Lab environments keep their nightly backups for 14 days; production environments keep them for 35 days.

Backups are stored in a separate region from the environment they protect. They are encrypted at rest with keys managed by the platform.

You can also take a manual backup before a risky change. Manual backups are kept for 7 days and count against the storage quota of the workspace.
